# 150mA, SOT23, Low-Dropout Linear Regulators with Internal Microprocessor Reset Circuit

## General Description

The MAX6329/MAX6349 are low-dropout, micropower linear voltage regulators with integrated microprocessor reset circuits. Each is available with preset +3.3V, +2.5V, +1.8V, or adjustable output voltages and can deliver up to 150mA load current. Employing internal P-channel MOSFET pass transistors, the devices consume only 25µA supply current, independent of the device load. The low supply current, low dropout voltage, and integrated reset functionality make these devices ideal for battery powered portable equipment.

The MAX6329/MAX6349 include an internal reset circuit that indicates when the regulator output drops below standard microprocessor supply tolerances (-5% or -10%). The reset output remains asserted for 100ms (min) after the regulator output exceeds the selected reset threshold, ensuring that supply voltages and clock oscillators have stabilized before processor activity is enabled. Reset outputs are available in push-pull (active-low or -high) and open-drain (active-low) options. The internal reset circuit replaces external microprocessor supervisors or RC-based reset time delays.

The MAX6329/MAX6349 are optimized for use with a 1µF (min) output capacitor. The regulator output voltage is adjustable with an external resistor-divider network at SET (reset threshold voltages track the desired output voltage). Each device includes thermal shutdown protection, output short-circuit protection, and reverse leakage protection. The MAX6329 includes a shutdown feature to reduce regulator current below 1µA (max) and the MAX6349 offers a manual reset input to assert a microprocessor reset while the regulator output is within specification.

## Applications

Hand-Held Instruments
Electronic Planners
Palm Top Computers
PCMCIA Cards
USB Devices
Cellular Telephones
Cordless Telephones
Modems

***Selector Guide appears at end of data sheet.***

***Typical Operating Circuit appears at end of data sheet.***

## Features

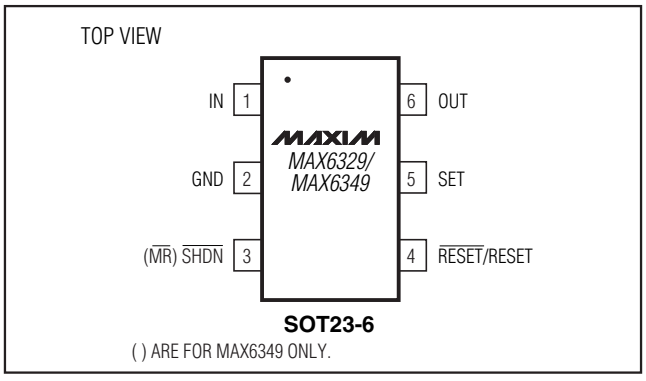

- ♦ **Preset +3.3V/+2.5V/+1.8V or Adjustable Regulator Output**
- ♦ **±3.0% Regulator Accuracy Over the Specifed Operating Range**
- ♦ **25µA Supply Current**
- ♦ **Low 180mV Dropout at 100mA Load**
- ♦ **Small Output Capacitor (1µF min ceramic or tantalum)**
- ♦ **Zero Reverse Leakage Current**
- ♦ **Thermal and Short-Circuit Protection**
- ♦ **Integrated Microprocessor Reset Circuit with 100ms (min) Timeout**
- ♦ **Open-Drain and Push-Pull Reset Outputs**
- ♦ **Regulator Shutdown Input (MAX6329) or Manual Reset Input (MAX6349)**
- ♦ **6-Pin SOT23 Package**

## Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
|---|---|---|
| **MAX6329**_ _ UT-T | 0°C to +85°C | 6 SOT23-6 |
| **MAX6349**_ _ UT-T | 0°C to +85°C | 6 SOT23-6 |

*These parts offer a choice of regulator/reset voltages and reset outputs. From the Selector Guide, insert the desired suffix letters into the blanks to complete the part number. Each device is available in nine standard versions. Sample stock is generally held on standard versions only (see Standard Versions table). Standard versions have an order increment requirement of 2500 pieces. Nonstandard versions have an order increment requirement of 10,000 pieces. Contact factory for availability of nonstandard versions.*

# 150mA, SOT23, Low Dropout Linear Regulators with Internal Microprocessor Reset Circuit

## ABSOLUTE MAXIMUM RATINGS

IN to GND .....-0.3V to +7V
$\overline{SHDN}$ to GND.....-0.3V to +7V
SET to GND .....-0.3V to ($V_{OUT}$ + 0.3V)
$\overline{MR}$ to GND .....-0.3V to +7V
RESET, $\overline{RESET}$ to GND, (Push-Pull) .....0.3V to ($V_{OUT}$ + 0.3V)
$\overline{RESET}$ to GNd,(Open-Drain).....-0.3V to ($V_{OUT}$ +0.3V)
OUT to GND .....-0.3V to +7V
Short-Circuit Duration.....Continuous
Maximum Current into Any Pin (except IN, OUT) .....±20mA

Continuous Power Dissipation ($T_A$ = +70°C)
6-Pin SOT23 (derate 7.1mW/°C above +70°C).....571mW
Thermal Resistance ($\theta_{JA}$) .....+140°C/W
Operating Temperature Range.....0°C to +85°C
Junction Temperature.....+150°C
Storage Temperature Range .....-65°C to +150°C
Lead Temperature (soldering, 10s) .....+300°C

*Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.*

## Pin Description

| PIN | NAME | DESCRIPTION |
|---|---|---|
| 1 | IN | Regulator Input. Supply voltage can range from +2.5V to +5.5V. |
| 2 | GND | Ground. This pin also functions as a heatsink. Solder to large pads or the circuit board ground plane to maximize thermal dissipation. |
| 3 | $\overline{SHDN}$ | **(MAX6329 Only)** Active-Low Shutdown Input. A logic low reduces the supply current to < 1µA. Connect |
| | $\overline{MR}$ | **(MAX6349 Only)** Active-Low Manual Reset Input. A logic low forces a reset. Reset remains asserted for the duration of the reset timeout period after $\overline{MR}$ transitions from low to high. Leave unconnected or connect to $V_{OUT}$ if not used. $\overline{MR}$ has an internal pullup resistor of 20kΩ (typ) to OUT. |
| 4 | $\overline{RESET}$ | Active-Low Reset Output. $\overline{RESET}$ remains low while $V_{OUT}$ is below the reset threshold or while $\overline{MR}$ is held low. $\overline{RESET}$ remains low for the duration of the reset timeout period after the reset conditions are terminated. |
| | RESET | Active-High Reset Output. RESET remains high while $V_{OUT}$ is below the reset threshold or while $\overline{MR}$ is held low. RESET remains high for the duration of the reset timeout period after the reset conditions are terminated. |
| 5 | SET | Feedback Input for Setting the Output Voltage. Connect to GND to set the output voltage to the preset fixed value (+3.3V, +2.5V, or +1.8V). Connect to an external resistor-divider network for adjustable output operation. |
| 6 | OUT | Regulator Output. Fixed (+3.3V, +2.5V, or +1.8V) or adjustable (+1.23V to +5.0V). Sources up to 150mA. Bypass with a 1µF minimum capacitor for full rated performance. |

## Detailed Description

The MAX6329/MAX6349 are low-dropout, low-quiescent current linear regulators with integrated microprocessor reset circuits. The devices drive loads up to 150mA and are available with preset output voltages of +3.3V, +2.5V, or +1.8V. The internal reset circuit monitors the regulator output voltage and asserts the reset output when the regulator output is below the microprocessor supply tolerance.

### Regulator

The regulator core operates with an input voltage range of +2.5V to +5.5V. The output voltage is offered with three fixed voltage options (+3.3V, +2.5V, and +1.8V) for the MAX6329 and MAX6349. Enable the fixed voltage output by connecting SET to ground. The MAX6329/MAX6349 offer an adjustable output voltage that is implemented with an external resistor-divider network connected to OUT, SET, and GND (Figure 1). SET must be connected to either GND or the external divider. The MAX6329/MAX6349 automatically determine the feedback path depending on the voltage seen at SET. Featured characteristics include ultra-low quiescent current and low dropout voltage. The *Typical Operating Circuit* shows a typical connection for the MAX6329. OUT is an internally regulated low dropout (LDO) linear regulator that powers a microprocessor.

### Reset Circuit

The reset supervisor circuit is fully integrated in the MAX6329/MAX6349 and uses the same reference voltage as the regulator. Two supply tolerance reset thresholds, -5% and -10%, are provided for each type of device:

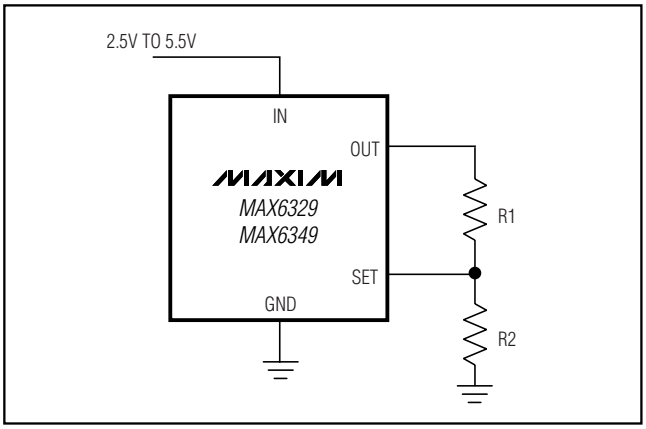

*Figure 1. Adjustable Output Voltage Configuration*

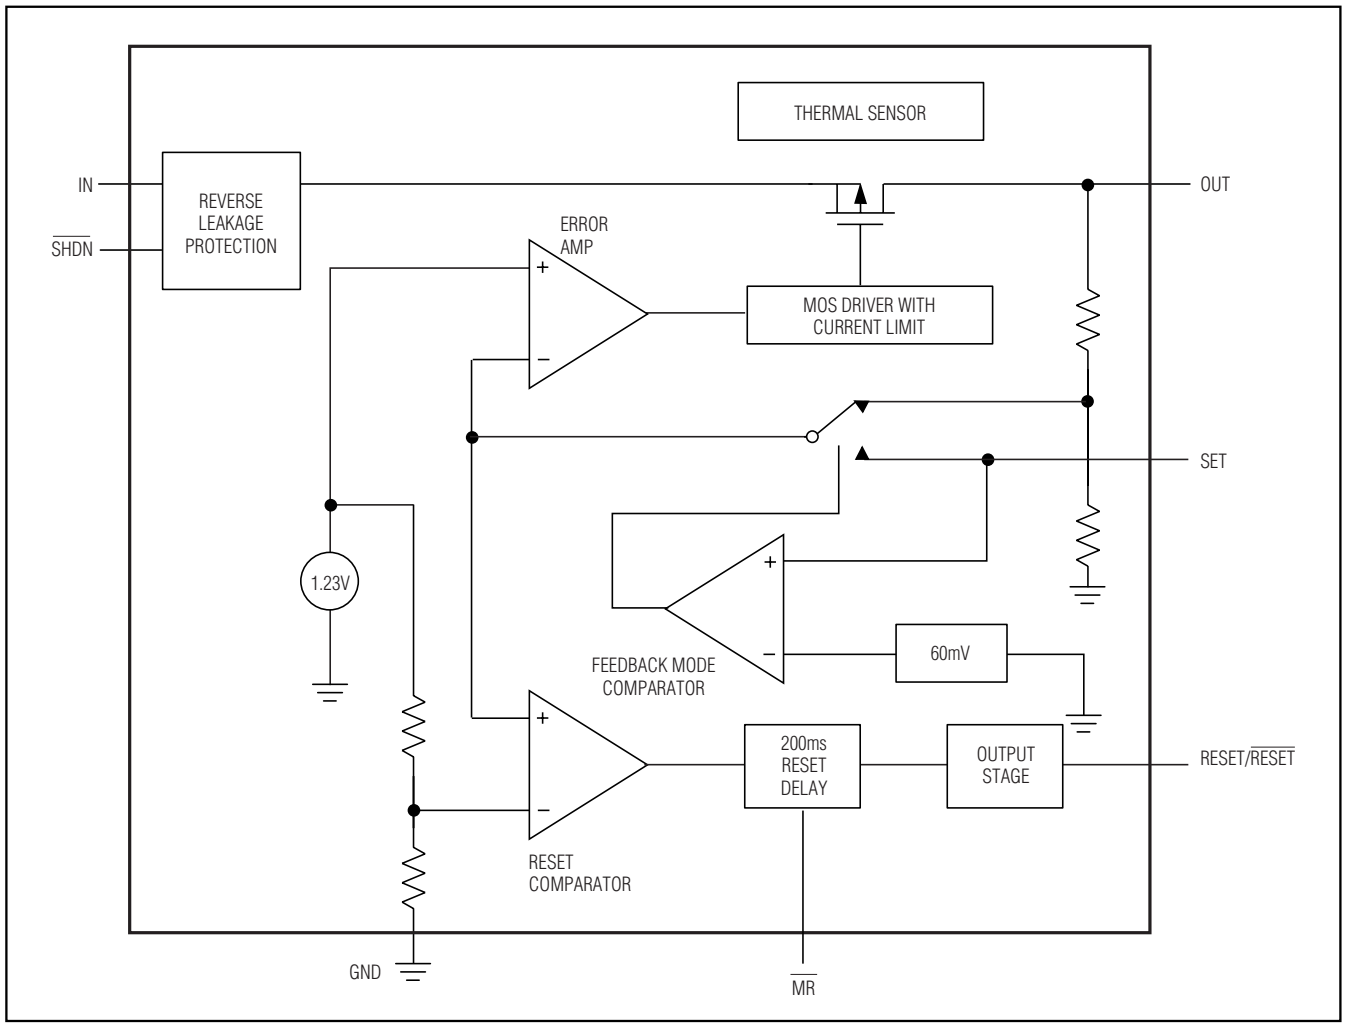

*Figure 2. Functional Diagram*

**5% reset:** Reset does not assert until the regulator output voltage is at least -5% out of tolerance and always asserts before the regulator output voltage is -10% out of tolerance.

**10% reset:** Reset does not assert until the regulator output voltage is at least -10% out of tolerance and always asserts before the regulator output voltage is -15% out of tolerance.

### *Reset Output*

A µP's reset input starts the µP in a known state. The MAX6329/MAX6349 µP supervisory circuits assert a reset during power-up, power-down, and brownout conditions. Reset is guaranteed to be logic high or low depending on the device chosen (see *Selector Guide*). RESET or $\overline{RESET}$ asserts when $V_{OUT}$ is below the reset threshold and for at least 100ms ($t_{RP}$) after $V_{OUT}$ rises above the reset threshold. RESET or $\overline{RESET}$ also asserts when $\overline{MR}$ is low (MAX6349).

### *Shutdown (MAX6329 Only)*

$\overline{SHDN}$ allows for the regulator to shutdown thereby reducing the total $I_{IN}$ consumption of the device. The MAX6329 provides a digitally controlled active-low shutdown function. In shutdown mode the pass transistor, control circuit, reference, and all biases turn off, reducing the supply current to below 1µA. Connect $\overline{SHDN}$ to IN for normal operation.

### *Manual Reset Input (MAX6349 Only)*

Many µP-based products require manual reset capability, allowing the operator, a test technician, or external logic circuitry to initiate a reset. For the MAX6349, a

# 150mA, SOT23, Low Dropout Linear Regulators with Internal Microprocessor Reset Circuit

logic low on $\overline{MR}$ asserts reset while the regulator is still within tolerance.

Reset remains asserted while $\overline{MR}$ is low and for the reset timeout period (100ms min) after $\overline{MR}$ returns high. The $\overline{MR}$ input has an internal pullup of 20kΩ (typ) to OUT. This input can be driven with TTL/CMOS logic levels or with open-drain/collector outputs. Connect a normally open momentary switch from $\overline{MR}$ to GND to create a manual reset function; external debounce circuitry is not required. If $\overline{MR}$ is driven from long cables or the device is used in a noisy environment, connect a 0.1µF capacitor from $\overline{MR}$ to GND to provide additional noise immunity.

### Reverse Leakage Protection

An internal circuit monitors the input and output voltages. When the output voltage is greater than the input voltage, the internal pass transistor and parasitic diodes turn off. OUT powers the device. There is no leakage path from OUT to IN. Therefore, the output can be powered from an auxiliary supply such as a backup battery without any need for additional blocking diodes.

### Current Limit

The MAX6329/MAX6349 include a current limiter that monitors and controls the pass transistor's gate voltage, limiting the output current to 350mA (typ). The output can be shorted to ground for an indefinite period without damaging the part.

### Thermal Overload Protection

When the junction temperature exceeds $T_J$ = +160°C, the thermal sensor signals the shutdown logic, turning off the pass transistor and allowing the IC to cool. The thermal sensor will turn the pass transistor on again after the IC's junction temperature cools by 20°C, resulting in a pulsed output during continuous thermal-overload conditions. Thermal overload protection is designed to protect the MAX6329/MAX6349 in the event of fault conditions. For continuous operation, do not exceed the absolute maximum junction temperature rating of $T_J$ = +150°C.

### Operating Region and Power Dissipation

The MAX6329/MAX6349s' maximum power dissipation depends on the thermal resistance of the case and circuit board, the temperature difference between the die junction and the ambient air, and the rate of airflow. The power dissipation across the device is:

$$P = I_{OUT} (V_{IN} - V_{OUT})$$

The maximum power dissipation is:

$$P_{MAX} = (T_J - T_A) / (\theta_{JB} + \theta_{BA})$$

where $T_J - T_A$ is the temperature difference between the die junction and the surrounding air, $\theta_{JB}$ (or $\theta_{JC}$) is the thermal resistance of the package, and $\theta_{BA}$ is the thermal resistance through the printed circuit board, copper traces, and other materials to the surrounding air.

The MAX6329/MAX6349s' ground pin (GND) performs the dual function of providing an electrical connection to the system ground and channeling heat away. Connect GND to the system ground using a large pad or ground plane.

## Applications Information

### Output Voltage Selection

The MAX6329/MAX6349 feature dual mode operation: they operate in either a preset voltage mode or an adjustable mode. In preset voltage mode, internal feedback resistors set the MAX6329/MAX6349 to +3.3V, +2.5V, or +1.8V (see *Selector Guide*). Select this mode by connecting SET to ground. In adjustable mode, select an output between 1.23V to 5.0V using two external resistors connected as a voltage divider to SET (Figure 1). The output voltage is set by the following equation:

$$V_{OUT} = V_{SET} (1 + R1/R2)$$

where $V_{SET}$ = 1.23V. To simplify resistor selection:

$$R1 = R2 (V_{OUT}/V_{SET} - 1)$$

Choose R2 ≥ 100kΩ to optimize power consumption, accuracy, and high-frequency power-supply rejection. Since the $V_{SET}$ tolerance is typically less than ±30mV, the output can be set using fixed resistors instead of variable resistors. In preset voltage mode, impedance between SET and ground should be less than 50kΩ.

### Capacitor Selection and Regulator Stability

For stable operation over the full temperature range and with load currents up to 150mA, use a 1µF (min) output capacitor. To reduce noise and improve load transient response, stability, and power-supply rejection, use large output capacitor values such as 10µF.

Note that some ceramic dielectrics exhibit large capacitance and ESR variation with temperature. With dielectrics such as Z5U and Y5V, it may be necessary to use 2.2µF or more to ensure stability at temperatures below -10°C. With X7R or X5R dielectrics, 1µF should be sufficient at all operating temperatures. A graph of the Region of Stable $C_{OUT}$ ESR vs. Load Current is shown in the *Typical Operating Characteristics*.

To improve power-supply rejection and transient response use a 1µF capacitor between IN and GND.

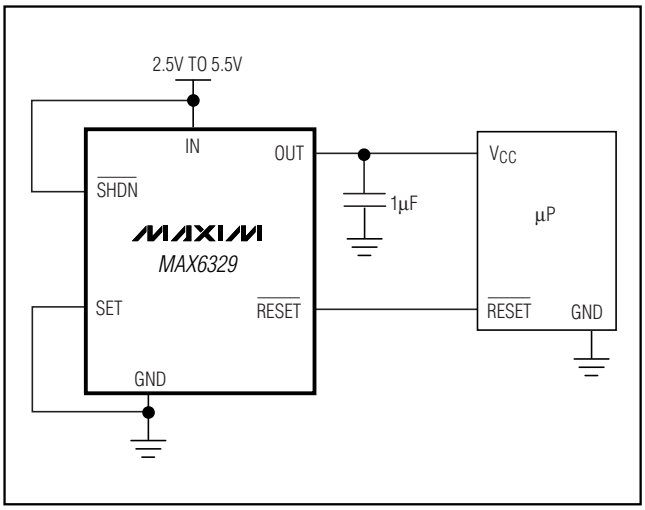

### Input-Output (Dropout) Voltage

A regulator's minimum input-output voltage differential (or dropout voltage) determines the lowest useable supply voltage. In battery powered systems, this will determine the useful end-of-life battery voltage. Since the MAX6329/MAX6349 use a P-channel MOSFET pass transistor, their dropout voltage is a function of $R_{DS(ON)}$ multiplied by the load current (see *Electrical Characteristics*).

### Negative Going OUT Transients

These supervisors are relatively immune to short-duration, negative going OUT transients. The *Typical Operating Characteristics* section shows a graph of the Maximum Transient Duration vs. Reset Threshold Overdrive for which reset is not asserted. The graph was produced using negative going OUT transients starting at OUT and ending below the reset threshold by the magnitude indicated (Reset Threshold Overdrive). The graph shows the maximum pulse width that a negative going OUT transient can typically have without triggering a reset pulse. As the amplitude of the transient increases (i.e., goes further below the reset threshold), the maximum allowable pulse width decreases. Typically, an OUT transient that goes only 10mV below the reset threshold and lasts for 75µs will not trigger a reset pulse.
